FORM PTO-1500		U.S. Department of Commerce, Patent and Trademark Office	Attorney's Docket No. 2145-133
TRANSMITTAL LETTER TO THE UNITED STATES DESIGNATED/ELECTED OFFICE (DO/EO/US) CONCERNING A FILING UNDER 35 U.S.C. 371			U.S. Application No. (if known, see 37 CFR 1.53) New Application No. 10/070246
INTERNATIONAL APPLICATION NO. PCT/A000/01022	INTERNATIONAL FILING DATE August 29, 2000	PRIORITY DATE CLAIMED September 3, 1999	
TITLE OF INVENTION Improved Bacterial Oxidation of Sulphide Ores and Concentrates			
APPLICANT(S) FOR DO/EO/US Colin John HUNTER, Tamsin Lisa WILLIAMS, Simon Anthony Roger PURKISS, Leo Wai-Chiu CHEUNG, Elena CONNORS, Ross David GILDERS			
Applicant herewith submits to the United States Designated/Elected Office (DO/EO/US) the following items and other information:			
1. [X] This is a FIRST submission of items concerning a filing under 35 U.S.C. 371 2. [] This is a SECOND or SUBSEQUENT submission of items concerning a filing under 35 U.S.C. 371 3. [X] This is an express request to begin national examination procedures (35 U.S.C. 371(f)). The submission must include items (5), (6), (9) and (21) indicated below. 4. [X] The US has been elected by the expiration of 19 months from the priority date (Article 31). 5. [X] A copy of the International Application as filed (35 U.S.C. 371(c)(2)) a. [] is attached hereto (required only if not communicated by the International Bureau). b. [] has been communicated by the International Bureau. c. [X] is not required, as the application was filed in the United States Receiving Office (RO/US) 6. [] An English language translation of the International Application as filed (35 U.S.C. 371(c)(2)). a. [] is attached hereto. b. [] has been previously submitted under 35 U.S.C. 154(d)(4). 7. [X] Amendments to the claims of the International Application under PCT Article 19 (35 U.S.C. 371(c)(3)) a. [] are attached hereto (required only if not communicated by the International Bureau). b. [X] have been communicated by the International Bureau c. [] have not been made; however, the time limit for making such amendments has NOT expired. d. [] have not been made and will not be made. 8. [] An English language translation of the amendments to the claims under PCT Article 19 (35 U.S.C. 371(c)(3)). 9. [] An oath or declaration of the inventor(s) (35 U.S.C. 371(c)(4)). 10. [] An English language translation of the annexes to the International Preliminary Examination Report under PCT Article 36 (35 U.S.C. 371(c)(5)).			
ITEMS 11. TO 20. below concern other document(s) or information included: 11. [X] An Information Disclosure Statement under 37 CFR 1.97 and 1.98. 12. [] An assignment document for recording. A separate cover sheet in compliance with 37 CFR 3.28 and 3.31 is included. 13. [X] A FIRST preliminary amendment. 14. [] A SECOND or SUBSEQUENT preliminary amendment. 15. [] A substitute specification. 16. [] A change of power of attorney and/or address letter. 17. [] A computer-readable form of the sequence listing in accordance with PCT Rule 13ter 2 and 35 U.S.C. 1.821-1.825 18. [X] A second copy of the published international application 19. [] A second copy of the English language translation of the international application under 35 U.S.C. 154(d)(4). 20. [X] Other items or information: International Preliminary Examination Report w/ 2 sheets of amended claims; PCT Request; PCT Demand; Notification of the Recording of a Change; International Search Report and 6 cited references.

PRELIMINARY AMENDMENT

Assistant Commissioner for Patents
Washington, D.C. 20231

Dear Sir:

Please amend the above-identified application as follows.

IN THE CLAIMS:

Please cancel claims 1-17 and substitute the following new claims.

- 18. A process for bacterial oxidation of sulphide ores or concentrates characterised in that an ore or concentrate is leached with a mixed bacterial culture operative across a temperature range of about 40 to 65 °C, the mixed bacterial culture having been adapted to the ore or concentrate prior to leaching.
19. A process according to claim 18, characterised in that the ore or concentrate is leached with the mixed bacterial culture in a heap leach, tank leach, vat leach or dump leach.
20. A process according to claim 18, characterised in that the ore or concentrate is either of a base metal, a precious metal or platinum group metal.
21. A process according to claim 18, characterised in that the sulphide ore or concentrate contains chalcopyrite.

-
22. A process according to claim 18, characterised in that the leach takes place in the temperature range of about 45 to 65°C.
23. A process according to claim 18, characterised in that the ore or concentrate is leach at a grind or crush size of greater than P_{80} 75 μm .
24. A process according to claim 23, characterised in that the grind or crush size of greater than P_{80} 90 μm .
25. A process according to claim 18, characterised in that the mixed bacterial culture comprises at least two of *Sulfobacillus thermosulfidooxidans*, *Thiobacillus caldus*, and *Thermobacillus ferrooxidans*.
26. A process according to claim 18, characterised in that the process of adaptation comprises addition of both a sample of the ore or concentrate and the mixed bacterial culture to a leach vessel, and leaching the resulting adaptation slurry until the level of targeted metal reporting to solution either reaches 100% or reaches a plateau.
27. A mixed bacterial culture for use in bacterial oxidation of sulphide ores and concentrates, characterised in that the mixed bacterial culture is not indigenous to the ore or concentrate to be oxidised, the mixed bacterial culture being able to oxidise the ore or concentrates across a range of leach temperature of about 40 to 65°C, and at a pH of between about 0.5 to 3.0.
28. A mixed bacterial culture according to claim 27, characterised in that the culture comprises at least two of *Sulfobacillus thermosulfidooxidans*, *Thiobacillus caldus*, and *Thermobacillus ferrooxidans*.
29. A mixed bacterial culture according to claim 27, characterised in that the mixed bacterial culture is able to oxidise chalcopyrite mineral ores and concentrates at grind or crush sizes equal to or greater than P_{80} 75 μm .

30. A mixed bacterial culture according to claim 29, characterised in that the grind or crush size is equal to or greater than P_{90} 90 μm . --

IN THE ABSTRACT:

Please substitute the Abstract of the Disclosure on the attached separate sheet with the Abstract currently of record.

REMARKS

The amendments have been made to eliminate multiple dependencies and present the claims in better U.S. form.

RESPECTFULLY SUBMITTED,

Marked-up version of Abstract to show changes made

A process for the bacterial oxidation of sulphide ores and concentrates wherein
[characterised in that] the ore or concentrate is leached with a mixed bacterial culture at a
temperature of between about 40 to 65°C, and at a pH of between about 0.8 to 2.2.

TITLE

"Improved Bacterial Oxidation of Sulphide Ores and Concentrates"

FIELD OF THE INVENTION

The present invention relates to the improved bacterial oxidation of sulphide ores
5 and concentrates using a mixed bacterial culture.

The bacterial oxidation process of the present invention has particular application
in the bacterial oxidation of ores and concentrates containing chalcopyrite.

BACKGROUND ART

Bacterial oxidation has been used for a number of years in successfully
10 processing arsenopyrite, pyrite, pyrrhotite, covellite and chalcocite ores and
concentrates, the one exception to this processing has been the oxidation of
chalcopyrite (CuFeS_2) ores and concentrates.

Prior art mixes of bacteria used to facilitate oxidation of sulphide ores and
concentrates, other than chalcopyrite ores and concentrates, use a variety of
15 suites of bacteria. For example, the mixed bacterial culture employed by Gencor
Limited of South Africa comprise predominantly *Thiobacillus ferrooxidans*,
Thiobacillus thiooxidans and *Leptospirillum ferrooxidans*. The Gencor cultures
consist of a mixed population of mesophilic bacteria, which operate in the
temperature range of 35°C to 45°C (Dew & Miller, 1997).

20 Further, Finnish Patent Application 953488 to Gencor Limited discloses the use of
Thiobacillus ferrooxidans, *Thiobacillus thiooxidans* and *Leptospirillum*
ferrooxidans to achieve oxidation at a pH of preferably 3 with an ore preferably
crushed to below 6mm.

The bacterial culture utilised by BacTech (Australia) Pty Ltd, see for example US
25 Patent 5429659, is a moderately thermophilic bacterial culture operating in the

temperature range of 46°C to 50°C. The culture has been designated "M4" by Barrett et al (1988) and has been described by Nobar et al. (1988) (Brierley and Brans 1994).

5 The MINBAC process developed by Mintek – Anglo American Corporation based in Randburg, South Africa utilises a mesophilic mixed bacterial culture comprising *Thiobacillus ferrooxidans/Leptospirillum ferrooxidans* (Brierley and Brans 1994).

The bacterial cultures presently used are unable to produce commercially acceptable results for chalcopyrite without either ultra fine milling ($p_{80} < 20\mu\text{m}$) of the ore or concentrate to facilitate bacterial oxidation, or the use of very long leach
10 times to achieve oxidation. Times of over 100 days are not uncommon.

Current trends are moving towards the use of higher temperatures to encourage ferric oxidation. However, the high temperatures employed lead to having to cool post-oxidation and to provide reactors formed of specialised materials, for example surgical grade stainless steel. Both circumstances increase the cost of
15 such an operation.

The process of the present has as one object thereof to overcome the abovementioned problems associated with the prior art, or to at least provide a useful alternative thereto.

The preceding discussion of the background art is intended to facilitate an
20 understanding of the present invention only. It should be appreciated that the discussion is not an acknowledgement or admission that any of the material referred to was part of the common general knowledge in Australia as at the priority date of the application.

Throughout this specification, unless the context requires otherwise, the word
25 "comprise", or variations such as "comprises" or "comprising", will be understood to imply the inclusion of a stated integer or group of integers but not the exclusion of any other integer or group of integers.

Throughout the specification, an ore is considered material that has been removed from the ground and does not receive any treatment to increase the metal concentration. A concentrate is produced by passing an ore through a treatment process, generally gravity or flotation, in order to increase the concentration of desired metals and decrease the volume of material which is subsequently treated to recover those desired metals.

DISCLOSURE OF THE INVENTION

In accordance with the present invention there is provided a process for the bacterial oxidation of sulphide ores and concentrates characterised in that the ore or concentrate is leached with a mixed bacterial culture at a temperature of between about 40 to 65°C, and at a pH of between about 0.8 to 2.2.

Preferably, the ore or concentrate is leached with the mixed bacterial culture in a heap leach, tank leach, vat leach or dump leach.

Still preferably, the ore or concentrate is either of a base metal, a precious metal or platinum group ore or concentrate. The sulphide ore or concentrate preferably contains chalcopyrite.

The leach may take place in the temperature range of about 45 to 60°C. The ore or concentrate may preferably be leached at a grind or crush size of up to and greater than P₈₀ 90 µm. Still preferably, the grind or crush size is between about P₈₀ 75 µm and P₈₀ 90 µm.

The mixed bacterial culture preferably comprises one or more of *Sulfobacillus thermosulfidooxidans*, *Thiobacillus caldus*, and *Thermobacillus ferrooxidans*. The mixed bacterial culture may first be adapted to the particular ore or concentrate. The process of adaption preferably comprises the addition of both a sample of the ore or concentrate and the mixed bacterial culture to a leach vessel, and leaching the resulting slurry until the level of targeted metal reporting to solution either reaches 100% or reaches a plateau.

The adaption slurry is preferably pH adjusted to a pH of between about 1.6 and 1.8.

In accordance with the present invention there is further provided a mixed bacterial culture for use in the bacterial oxidation of sulphide ores and concentrates, characterised in that the mixed bacterial culture is able to oxidise the ores and concentrates at leach temperatures of between about 45 to 65°C, and at a pH of between about 0.8 to 2.2.

Preferably, the culture comprises one or more of *Sulfobacillus thermosulfidooxidans*, *Thiobacillus caldus*, and *Thermobacillus ferrooxidans*.

- 10 The mixed bacterial culture is preferably able to oxidise chalcopyrite mineral ores and concentrates at grind or crush sizes up to and greater than P₈₀ 90 µm. The grind or crush size is still preferably between about P₈₀ 75 µm and P₈₀ 90 µm.

BRIEF DESCRIPTION OF THE DRAWINGS

- The present invention will now be described, by way of example only, with reference to the accompanying Figure, in which:-

Figure 1 is a photographic representation of the denaturing gradient gel results for six samples of the mixed bacterial culture of the present invention, processed by three different methods.

DESCRIPTION

- 20 In order to raise a culture capable of processing chalcopyrite ores and concentrates a bacterial culture indigenous to a chalcopyrite mineral was sought. Indigenous bacterial cultures are typically superior to modified isolated cultures as the indigenous culture has already been adapted to the toxins and mineral components associated with a particular ore resulting in more effective and
25 resilient bacterial strains.

Bacterial cultures indigenous to chalcopyrite ores were cultivated and tested for their ability to oxidise both their native ore/concentrate and other chalcopyrite ores and concentrates. During this program of work a culture was raised from a chalcopyrite (CuFeS_2) concentrate obtained from a base metal ore found in New Brunswick, Canada. Following the isolation of the bacterial culture, testing of the culture has taken place on both its' native ore and concentrate, and on a variety of other ores and concentrates. Additions to the original culture have taken place as, during testing of the culture of different materials, any native bacteria capable of operating under the parameters of the test and being able to operate competitively with the introduced culture have not only survived but have thrived in the environment. In this way any bacteria native to the ore or concentrate being tested have been incorporated into the culture. In addition, the culture has been grown successfully at different temperatures ranging from 40°C to 65°C and at varying levels of acidity with pH levels ranging from 0.8-2.2. Successful testing of the culture has taken place in both aerated agitated stirred tank reactors and in aerated columns to facilitate column leaching. Successful testing of the culture took place at a variety of temperatures and on a variety of ores and concentrates.

The mixed bacterial culture of the present invention consists of a variety of iron, sulphide and sulphur oxidising bacteria capable of working at temperatures of up to 65°C and at pH ranges of between 0.8 and 2.5. The mixed bacterial culture may include, but is not limited to, *Sulfobacillus thermosulfidooxidans*, *Thiobacillus caldus*, *Thermobacillus ferrooxidans* and a number of as yet unidentified bacterial species. The mixed bacterial culture of the present invention has been deposited at the Australian Government Analytical Laboratories under Accession No. NM99/07541.

Example

Prior to testing any material the stock bacterial culture is first adapted to the material of interest. This is facilitated by placing 2700 ml of modified OK solution (1.0 g/L ammonium sulphate, 0.5 g/L di-potassium orthophosphate, 0.16 g/L magnesium sulphate heptohydrate, pH 1.6 – 1.8) into an agitated aerated stirred tank reactor heated to the required temperature. To the modified OK medium a

150g sample of milled ($P_{80} < 45 \mu\text{m}$) test material is added and the pH adjusted down to between 1.6 and 1.8 if necessary using concentrated sulphuric acid. To this slurry a 300 ml slurry sample of the stock inoculum is introduced. The agitated reactor is aerated at a rate of 1L/min/L slurry. The adaption is continued until the level of relevant metals reporting to solution reaches either 100% or reaches a plateau. Solution samples are assayed for metal levels in solution through the use of an ICP, where appropriate the pH of the slurry is adjusted with concentrated sulphuric acid so that the pH is between 1.6 and 1.8. In addition to metal levels reporting to solution the progress of the adaption/test is further monitored according to its oxidation reduction potential (ORP), ferrous concentration and dissolved oxygen concentration (DO).

Once the culture has adapted to the material of interest it is used as an inoculum for further agitated aerated stirred tank reactor tests or as an inoculum for heap or column tests. The adapted bacterial inoculum is diluted further through the addition of an acidic basic nutrient solution containing ammonium sulphate, potassium orthophosphate and magnesium sulphate. The concentration of these nutrients in solution may vary between laboratory tests and commercial operation and between different commercial operations. In all cases the progress of oxidation is monitored through the levels of metals reporting to solution, pH, ORP, ferrous concentration and DO content.

The mixed bacterial culture of the present invention was tested on a range of chalcopyrite bearing samples from various locations around the world. Table 1 below illustrates the mineralogy and origin of the chalcopyrite concentrates and ores tested using the bacterial culture of the present invention.

TABLE 1

Sample	Mineralogy	Origin
A	Chalcopyrite copper concentrate.	USA
B	Molybdenum concentrate with low levels of copper in chalcopyrite.	Canada
C	Concentrate comprising predominantly chalcopyrite (35%) and cubanite (17%) with lesser quantities of pyrrhotite (10%)	Canada

	and minor amounts of pentlandite (3%) and sphalerite (3%).	
D	Copper Nickel concentrate in which copper is present as both chalcopyrite (18.5 – 28.5%) and cubanite (15.8 – 30.8%). Nickel is present as pentlandite (17.7 – 10.4%) and occasionally replaced as violarite.	USA
E	Three copper concentrates consisting of chalcopyrite, pyrite and minor amounts of bornite.	Canada
F	Copper concentrate consisting of chalcocite (14%), chalcopyrite (10%), bornite (1%) and pyrite (1%).	South Africa
G	Samples i and iii are ore samples and sample ii is a concentrate sample. The sulphide minerals are predominantly pentlandite, chalcopyrite and pyrrhotite.	Western Australia

General test procedure

All tests on mineral samples were conducted in agitated aerated tank reactors. Each test had a solids density of 10%w/v and was aerated by sparging at a rate of 1L air per minute per litre of slurry in the reactor. The evaporative losses due to the heating and aeration of the slurry were made up prior to sampling the tests. This was accomplished through the addition of tap water. All slurries were made up in a proprietary nutrient media with a starting pH of 1.0. Sampling involved assaying the solution for iron, copper and other relevant metal ions. In addition, the oxidation-reduction potential (ORP), pH, ferrous iron and dissolved oxygen levels were also monitored and recorded. Copper release was used to monitor the progress of the test and once this reached a stable plateau or attained approximately 100% of the copper reporting to solution the test was deemed complete. Once complete the pulps were pressure filtered, the final leach liquor assayed and the filter cake washed with acidified water and dried. The dried filter cake was weighed and the residue assayed in order to conduct a metallurgical balance.

The results from head analysis, particle size analysis and the results following oxidation are summarised and displayed in Table 2.

TABLE 2

- 5 A number of samples of the adapted bacterial culture of the present invention have been grown at temperatures ranging from 35°C to 65°C, samples from each of the cultures have been removed and prepared for identification using 16SrRNA sequencing. Preparation of the samples prior to RNA sequencing was undertaken using three different methods. The methods used and the results obtained from 16SrRNA sequencing are as follows.
- 10

Methods

Six samples (designated SN 45, P45, SS 45, RH 14K, and 014A) were tested.

The samples were mixed on a hand shaker at maximum speed for 30 minutes and processed as follows:

A Shaken. 500 μ l of the shaken sample was immediately sedimented onto glass fibre filters (#30 Sliecher and Schuell, Keene, NH) in a 1.5 ml microtube by centrifugation at 14Krpm for 4 minutes. The supernatant was carefully removed, and the sedimented material was washed twice in 1 ml of tissue culture grade water.

B. Fast Prep. 500 μ l was immediately removed and homogenized using a Savant BIO 101 Fast Prep machine (BioCan Scientific) at speed 4 for 20 seconds. The homogenates were sedimented and washed as described above.

C. Supernatant. Following shaking, the samples were allowed to sit for 5 minutes to allow the particulate matter to settle to the bottom of the tubes. 500 μ l of the supernatant was then sedimented and washed as previously described.

RNA was extracted from all samples using InstaGene Matrix (BioRad, Hercules, CA) as per manufacture's instructions. The RNA concentration was determined by uv spectrophotometry (A_{260}) and 50 ng were added to the PCR reaction mixture with a final concentration of 2mM magnesium ion, 100 μ M dNTP, 0.32 μ M each primer and 0.625 units of Taq Gold Polymerase. The universal primers p515f and p806r (Relman 1993) were used to amplify an approximately 300bp segment of the 16S ribosomal RNA gene. The forward primer was modified with a 40bp GC rich sequence that terminated the migration of the amplified product at various concentrations of urea/formamide within a denaturing gradient gel (Sheffield et al. 1989; Muyzer et al. 1993) Bands of interest were cut from the denaturing gels and purified amplified product was subjected to cycle sequencing using Big Dye Terminator extension from the reverse primer using the conditions recommended (PE Applied Biosystems). Sequence determination was performed on a 310 Genetic Analyser (PE Applied Biosystems). Sequence comparisons were conducted using the basic local alignment search tool (BLAST; Altschul et al. 1990).

Results

Each of the three samples processing methods resulting in a different profile for the same sample, as shown in Figure 1. Nine predominant bands were selected for sequencing. The 300bp segments sequenced had the closest match with partial sequences of the 16S rRNA gene of the bacterial species listed in the BLAST result column. A larger 16S segment would have to be sequenced for more precise identification.

A summary of the BLAST search results for the 300 base pair 16S rRNA gene segments sequenced is shown in Table 3. The numbers in parentheses refer to the % homology between the unknowns and their closest matches.

inefficient drainage of the heap will occur resulting in pooling in the heap and a high phreatic head. If on the other hand the ore size is too coarse, drainage of the heap will be fast and the level of metals in solution will be low, in addition the structure of the heap may fail as the ore is broken down through biological and chemical processes. In many cases the crushed ore is agglomerated with binders, sulphuric acid and water prior to stacking, the result being a more uniform particle size and acid distribution throughout the heap.

Prior to stacking the heap a drainage layer is usually placed on the pad, this is generally composed of unreactive rock such as quartzite and ensures adequate drainage of the pregnant liquor. Heaps are irrigated with acidified bacterial liquor which acts as the lixiviant for leaching of the copper from the ore. The bacteria employed in heap leaching are generally aerobic and therefore require oxygen. This may be forced into the heap by means of low pressure blowers or air may be sucked into the heap due to a chimney effect that occurs as bacteria oxidise ore and create heat.

The Geocoat process is a variation on heap leaching and has been marketed by US company Geobiotics. The process involves producing a concentrate from the sulphidic ore, coating this onto crushed, sized rock and producing a heap that can be subjected to bacterial oxidation.

Dump leaching is very similar to heap leaching and is generally reserved for lower grade ores. Often dump leaching will be considered as an accompanying process to heap leaching rather than a stand alone project in its own right. Essentially, where waste or low grade rock is to be mined and stockpiled anyway, with little ground preparation beforehand, some value can be extracted from the material. Indigenous bacteria will be present in the heap and all that is required is to promote their activity. This is done by the addition of acid and nutrients to the irrigation solution, such as with heap leaching. The difference is in the cost.

Little or no crushing will be performed prior to stacking. Only the bare minimum of pad preparation will be performed. There will be no forced aeration.

Vat leaching can be considered to be intermediate between heap leaching and tank leaching in terms of cost, sophistication and efficiency. It is a process in which the material to be treated is fully immersed in the leach solution but is not agitated, at least not to any significant extent, though some agitation due to the air and/or solution flow may take place. The process has the advantage over heap or dump leaching in that complete wetting of the mineral surfaces is achieved and channelling is avoided. Finer crush sizes can also be handled better in a vat, though there is still a limit to the fineness imposed by the need for permeability by both the air and solution. Beyond this limit, it becomes necessary to suspend the material in the solution. If the vats are to be single use only, they can be constructed as lined dams, sloped to one corner to allow circulation and recovery of the leach liquor. Multiple use vats would need to be of a more robust construction such as concrete or brick. Aeration would be by submerged pipe or could otherwise be accomplished by intermittently draining the vat and allowing air to be drawn into the ore by the retreating liquor.

Tank leaching, as the name suggests, entails the bacterial leaching of aerated mineral slurries in agitated tanks. The technology was pioneered by Gencor and is now well developed for the treatment of gold. It is envisaged that the technology would be very similar for base metal bio-leaching, but to date a system for copper has not been commercially developed.

Available results indicate that the costs associated with ultra-fine milling of the concentrate ($P_{80} < 30 \mu\text{m}$) can be expected to make the capital and operating costs too high.

The process of the present invention is capable of operating at a wide range of temperatures, thereby leading to a reduction in costs associated with cooling bacterial oxidation systems. The process is further capable of oxidising all forms of chalcopyrite, and at crush sizes that need not incur significant capital and operating costs.

Modifications and variations such as would be apparent to the skilled addressee are considered to fall within the scope of the present invention.

CLAIMS

1. A process for the bacterial oxidation of sulphide ores and concentrates characterised in that the ore or concentrate is leached with a mixed bacterial culture at a temperature of between about 40 to 65°C, and at a pH of between
5 about 0.8 to 2.2.
2. A process according to claim 1, characterised in that the ore or concentrate is leached with the mixed bacterial culture in a heap leach, tank leach, vat leach or dump leach.
3. A process according to claim 1 or 2, characterised in that the ore or
10 concentrate is either of a base metal, a precious metal or platinum group ore or concentrate.
4. A process according to any one of claims 1 to 3, characterised in that the sulphide ore or concentrate contains chalcopyrite.
5. A process according to any one of the preceding claims, characterised in that
15 the leach takes place in the temperature range of about 45 to 60°C.
6. A process according to any one of the preceding claims, characterised in that the ore or concentrate is leached at a grind or crush size of up to and greater than P₈₀ 90 µm.
7. A process according to claim 6, characterised in that the grind or crush size is
20 between about P₈₀ 75 µm and P₈₀ 90 µm.
8. A process according to any one of the preceding claims, characterised in that the mixed bacterial culture comprises one or more of *Sulfobacillus thermosulfidooxidans*, *Thiobacillus caldus*, and *Thermobacillus ferrooxidans*.
9. A process according to any one of the preceding claims, characterised in that
25 the leach is carried out over a period of between 8 to 36 days.

10. A process according to any one of the preceding claims, characterised in that the mixed bacterial culture is first adapted to the particular ore or concentrate.
11. A process according to claim 10, characterised in that the process of adaption comprises the addition of both a sample of the ore or concentrate and the mixed bacterial culture to a leach vessel, and leaching the resulting slurry until the level of targeted metal reporting to solution either reaches 100% or reaches a plateau.
12. A process according to claim 11, characterised in that the adaption slurry is pH adjusted to a pH of between about 1.6 and 1.8.
- 10 13. A mixed bacterial culture for use in the bacterial oxidation of sulphide ores and concentrates, characterised in that the mixed bacterial culture is able to oxidise the ores and concentrates at leach temperatures of between about 45 to 65°C, and at a pH of between about 0.8 to 2.2.
14. A mixed bacterial culture according to claim 13, characterised in that the culture comprises one or more of *Sulfobacillus thermosulfidooxidans*,
15 *Thiobacillus caldus*, and *Thermobacillus ferrooxidans*.
15. A mixed bacterial culture according to claim 13 or 14, characterised in that the mixed bacterial culture is able to oxidise chalcopyrite mineral ores and concentrates at grind or crush sizes up to and greater than P₈₀ 90 µm.
- 20 16. A mixed bacterial culture according to claim 15, characterised in that the grind or crush size is between about P₈₀ 75 µm and P₈₀ 90 µm.
17. A mixed bacterial culture according to any one of claims 13 to 16, characterised in that the leach is carried out over a period of between 8 to 36 days.

A process for the bacterial oxidation of sulphide ores and concentrates wherein the ore or concentrate is leached with a mixed bacterial culture at a temperature of between about 40 to 65°C, and at a pH of between about 0.8 to 2.2.

DECLARATION AND POWER OF ATTORNEY FOR UTILITY OR DESIGN PATENT APPLICATION (37 CFR 1.63) <input type="checkbox"/> Declaration Submitted with Initial Filing <input checked="" type="checkbox"/> Declaration Submitted after Initial Filing		Attorney Docket No.	2145-133
		First Named Inventor	Colin John HUNTER
		COMPLETE IF KNOWN	
		Application Number	PCT/AU00/01022
		Filing Date	29 August 2000
		Group Art Unit	
		Examiner Name	

As a below named inventor, I hereby declare that:

My residence, mailing address, and citizenship are as stated below next to name.

I believe I am the original, first and sole inventor (if only one name is listed below) or an original, first and joint inventor (if plural names are listed below) of the subject matter which is claimed and for which a patent is sought on the invention entitled: **IMPROVED BACTERIAL OXIDATION OF SULPHIDE ORES AND CONCENTRATES**, the specification of which is was filed on 29 August 2000 as PCT International Application Number PCT/AU00/01022 and was amended on March 4, 2002.

I hereby state that I have reviewed and understand the contents of the above identified specification, including the claims, as amended by any amendment specifically referred to above.

I acknowledge the duty to disclose information which is material to patentability as defined in 37 CFR 1.56, including for continuation-in-part applications, material information which became available between the filing date of the prior application and the national or PCT international filing date of the continuation-in-part application.

I hereby claim foreign priority benefits under 35 U.S.C. 119(a)-(d) or 355(b) of any foreign application(s) for patent or inventor's certificate, or 365(a) of any PCT international application which designated at least one country other than the United States of America, listed below and have also identified below, by checking the box, any foreign application for patent or inventor's certificate, or any PCT international application having a filing date before that of the application on which priority is claimed.

Prior Foreign Application Numbers	Country	Foreign Filing Date (MM/DD/YYYY)	Priority Not Claimed	Certified Copy Attached? YES NO
